

Using Proteomics to Understand Ocean Acidification Stress in the Pacific Oyster

Emma Timmins-Schiffman (UW, SAFS)

Brook Nunn (UW, Med. Chem.)

David Goodlett (UW, Med. Chem.)

Gary Dickinson (The College of NJ)

Steven Roberts (UW, SAFS)

Crassostrea gigas

- Important aquaculture species in the PNW and worldwide
- Ecological services: water filtration, habitat, food

Ocean Acidification and Bivalves

pCO₂

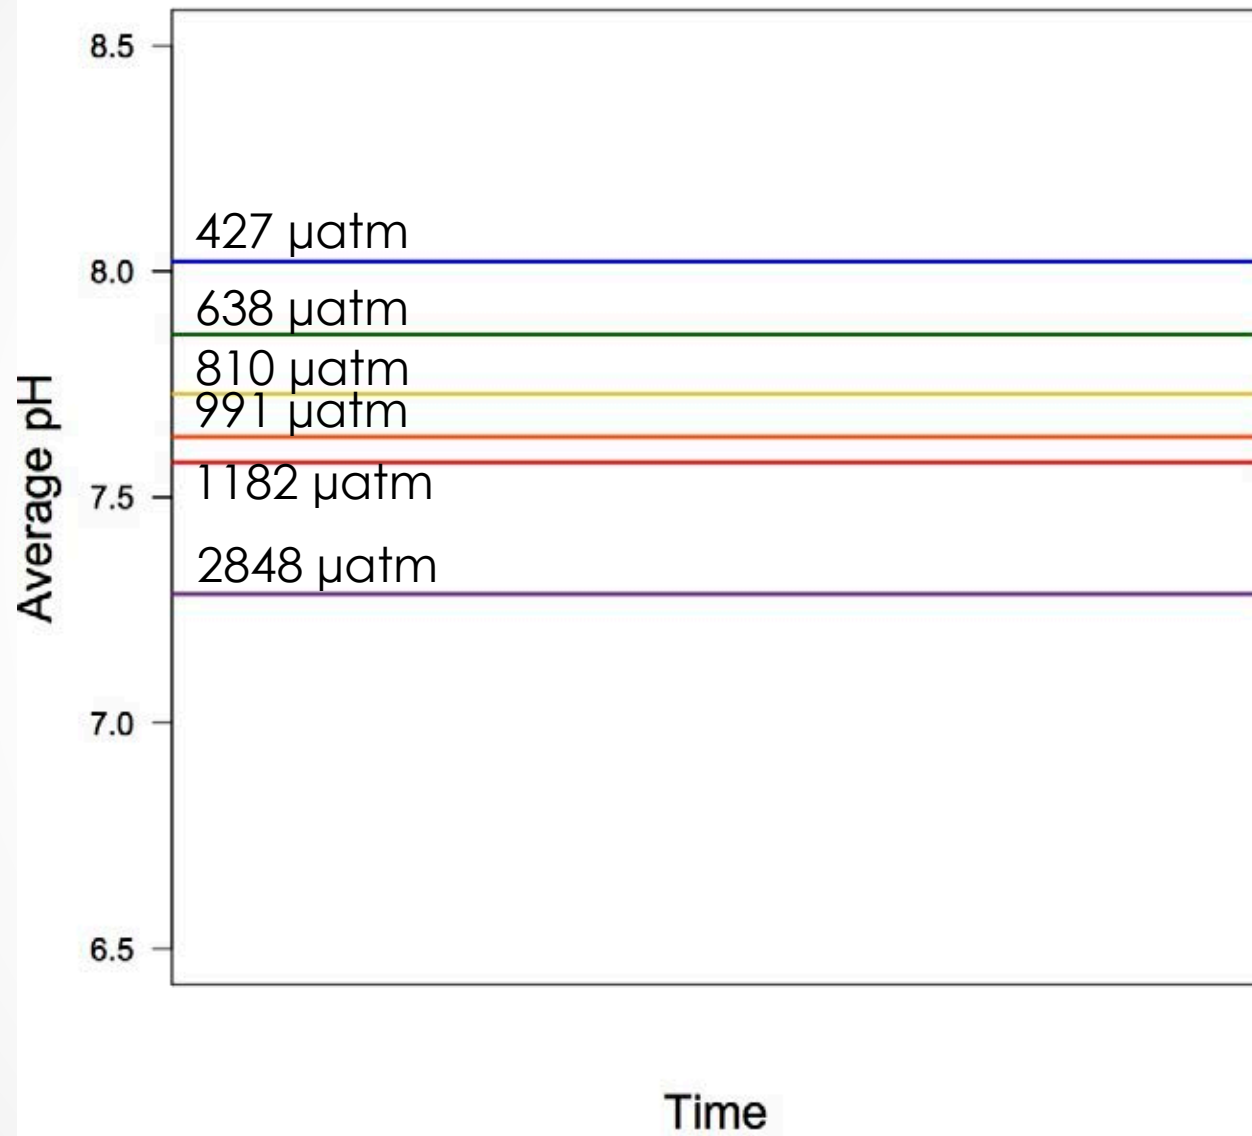

Energy/resource use

Growth & calcification

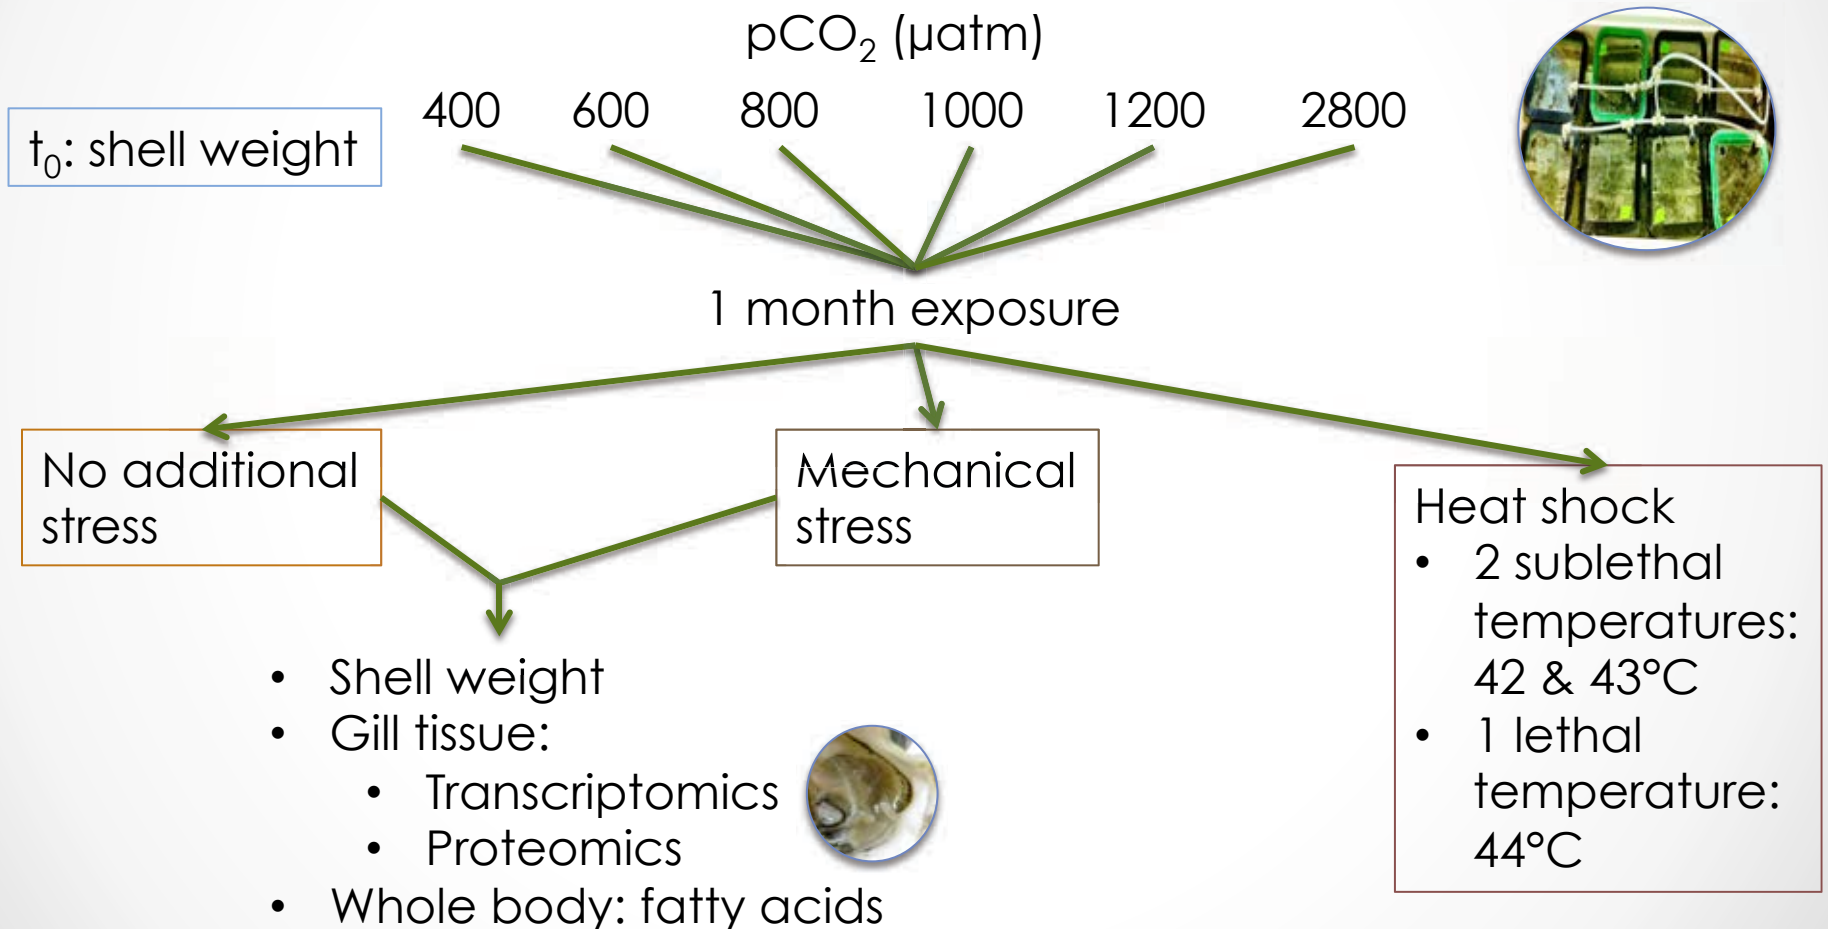

- Acidosis and shell dissolution
- CO₃²⁻ availability

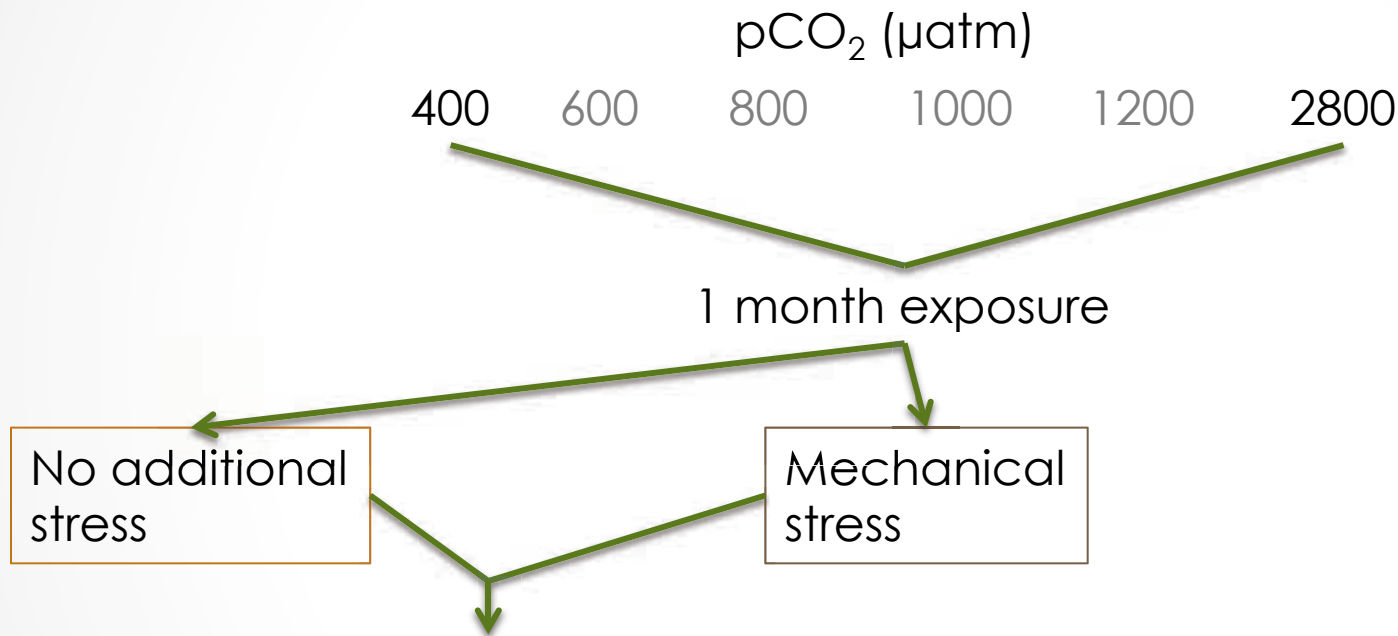

Characterize how ocean acidification affects the oyster's response to a second stressor

Experimental Design

Experimental Design

- Shell weight
- Gill tissue:
 - Transcriptomics
 - **Proteomics**
- Whole body: fatty acids

Experimental Design

- Mechanical stress as a proxy for environmental stress
- MS promotes a catecholamine stress response in *C. gigas* (Lacoste et al. 2001)

Methods: Proteomics

- Expression of genes and proteins change in response to the environment
- Shotgun techniques provide non-biased surveys of molecular physiological changes

Normal environment

Stressful environment

Protein Expression

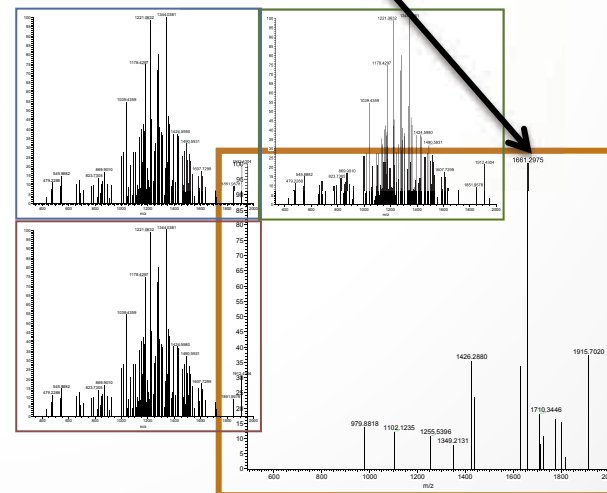

Methods: Proteomics

- Shotgun sequencing using LC-MS/MS
- Protein fragments (peptides) are sequenced
- Sequences are identified using a database of proteins

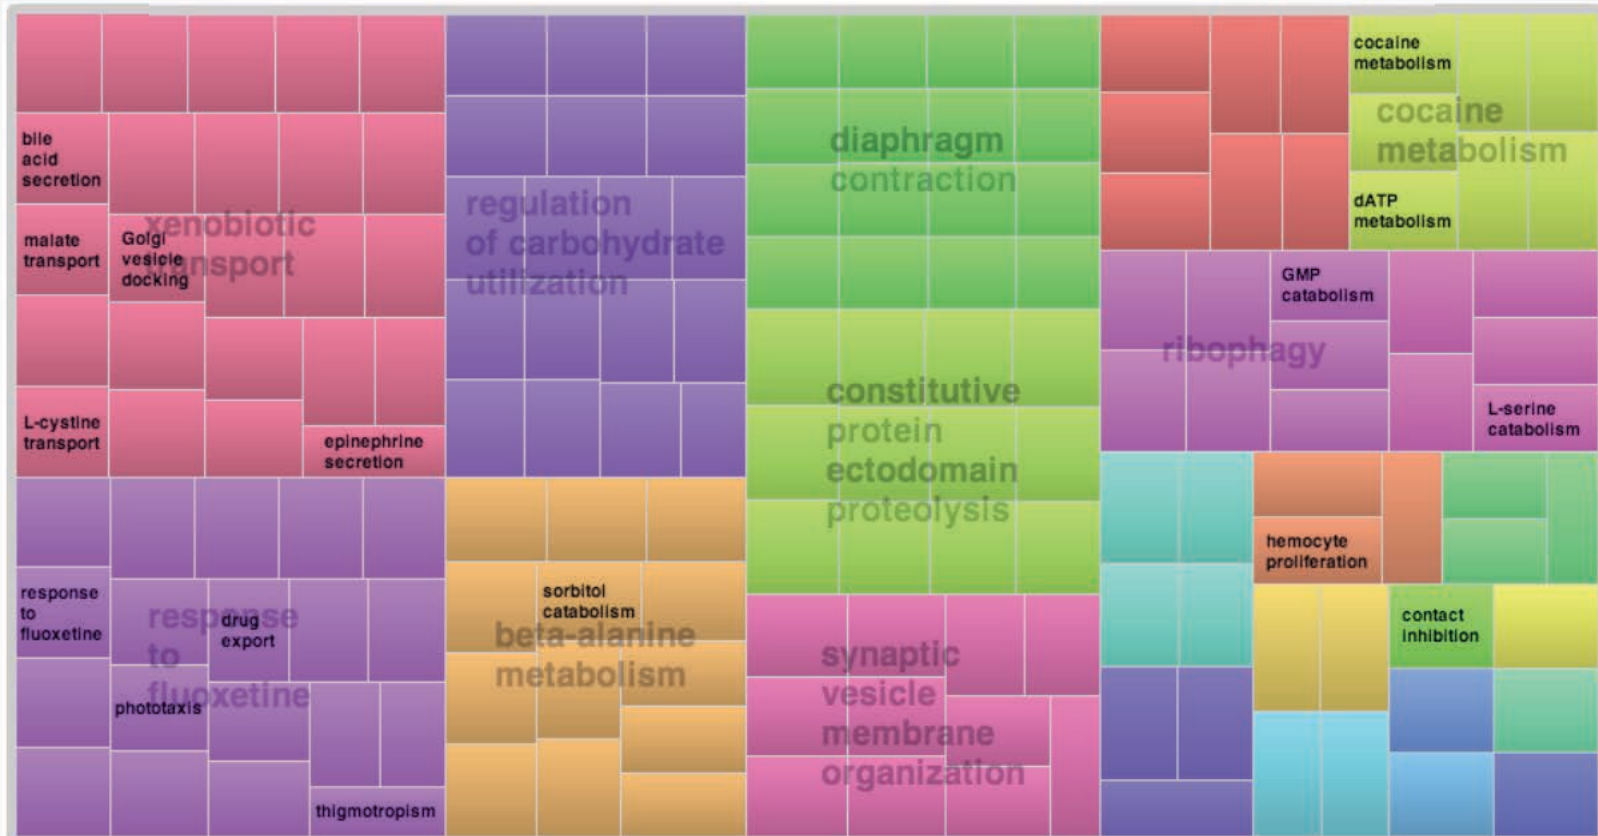

Sequenced spectrum

Matched to "spectrum" in database

Results: Proteomics

- 2,677 proteins were identified
- Coverage of entire *C. gigas* proteome: 9.5%

Results: Proteomics

Color

log₁₀ p-value

Transcriptional processes are the most significantly enriched process

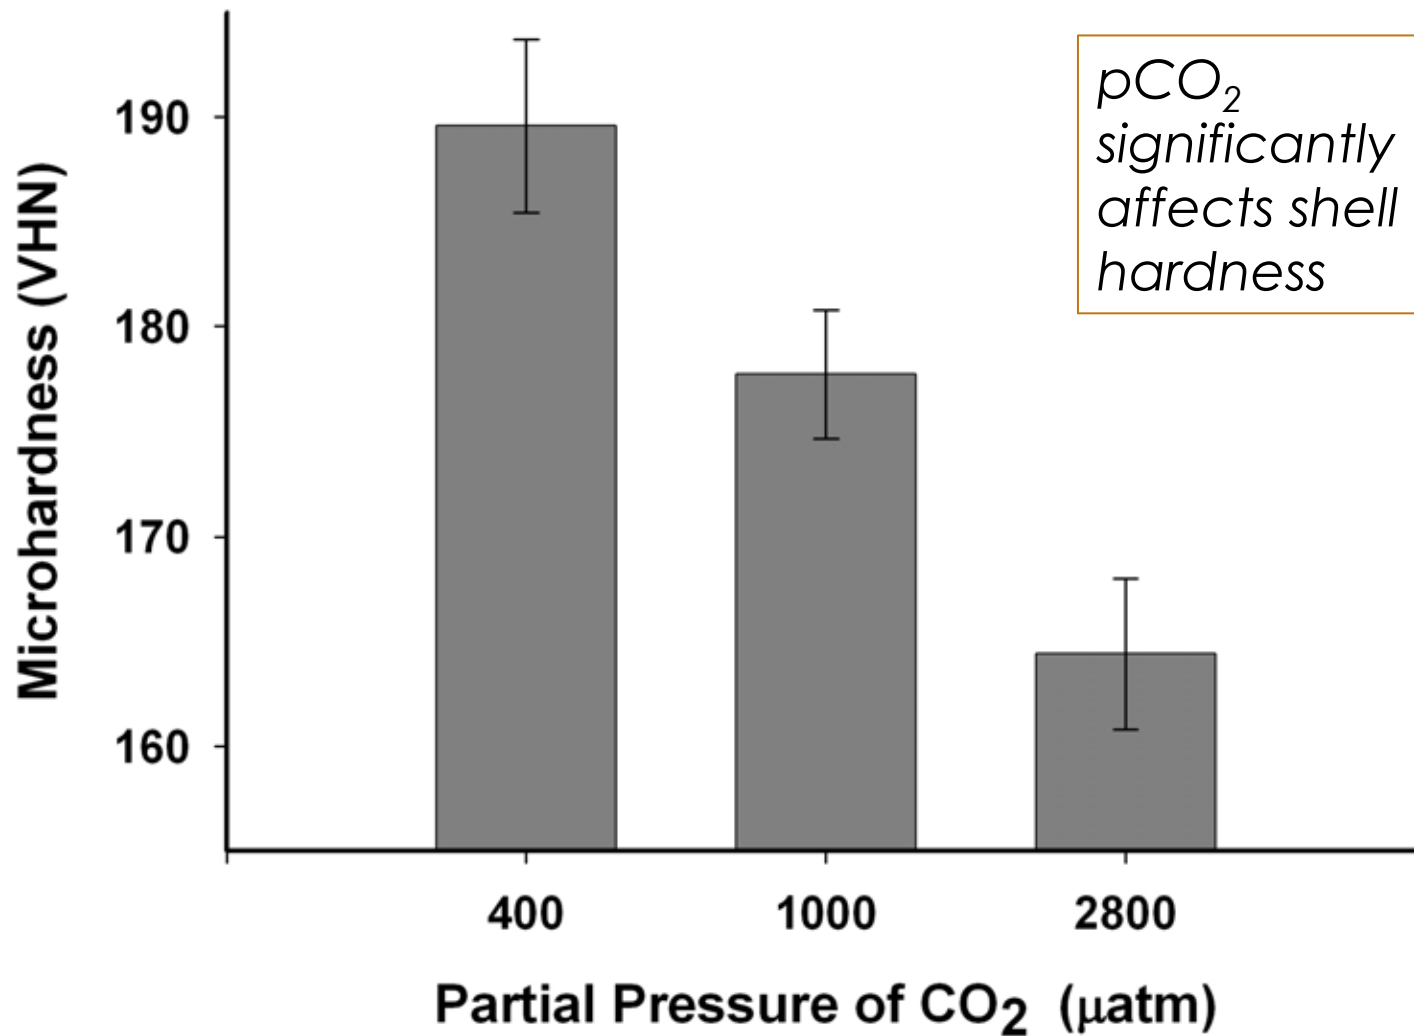

pCO₂

pCO₂ has an effect on the proteome

$p\text{CO}_2$

Mechanical Stress

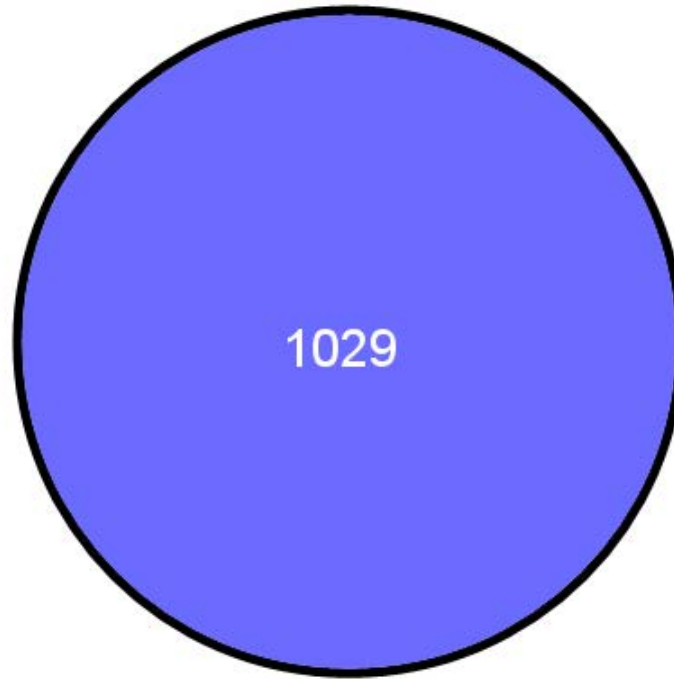

Mechanical Stress

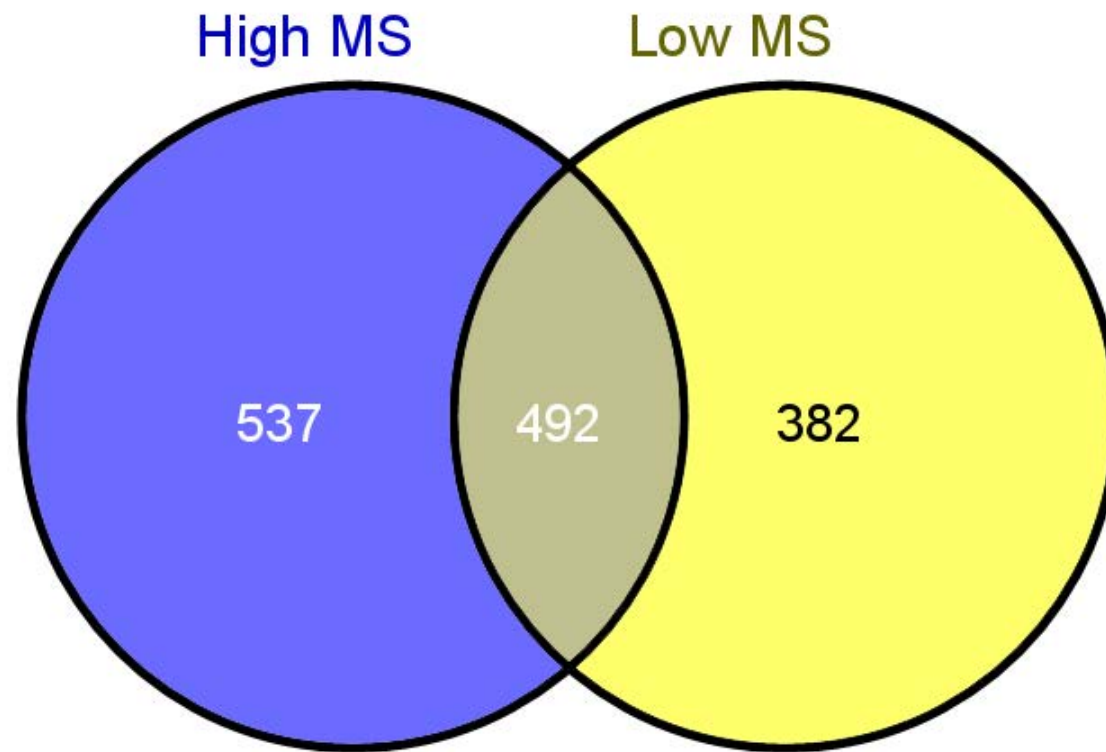

There is less of a proteomic response to a second stressor at high pCO₂

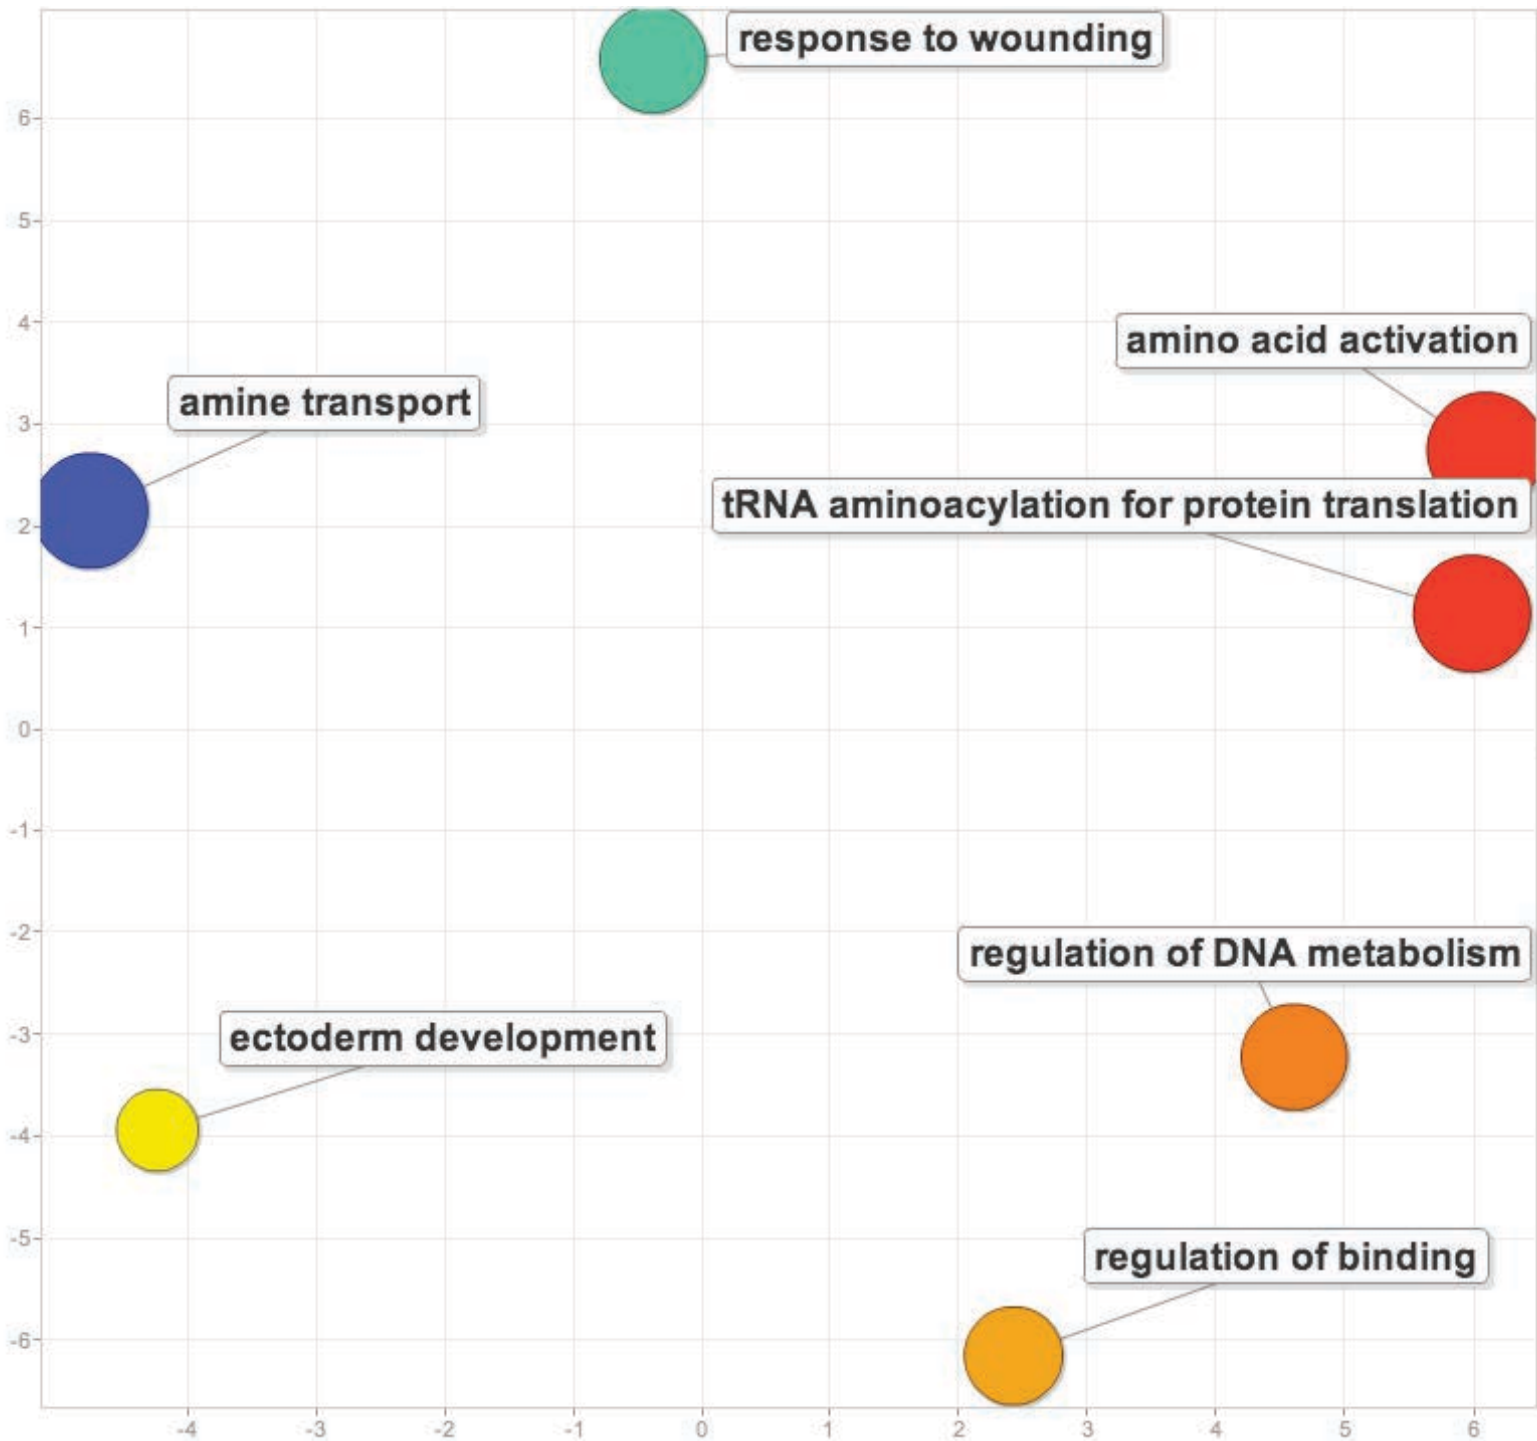

Mechanical Stress

High MS

Mechanical Stress

pCO₂ and Mechanical Stress

- Stress Response
 - Heat shock protein 70
 - Caspase
- pH Homeostasis
 - V-type proton ATPase
- Immune Response
 - Cathepsin B
 - MAP kinase kinase

Summary

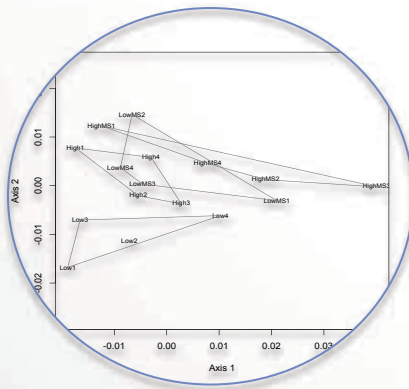

Proteomics can provide insight into the physiological response to ocean acidification.

Summary

Exposure to multiple stressors can impact an organism's ability to mount a successful response to either stressor.

Implications

We should continue to consider multiple stressors when assessing responses to environmental change.
